The Flexible Modular Range

Our Flexible Modular toilet system provides the highest quality in toilet systems. Stylish, modern and extremely versatile, we build directly into your marquee or chosen venue. We can connect to the mains drainage system if available or alternatively provide waste holding tanks. Stable, flat ground is required. The system is not designed for outside use and you may need to provide separation walls between ladies and gentlemen facilities.

System Requirements

SITING - A firm level base protected from weather.

POWER - A standard 3+1 setup will need 1x13amp single phase supply (240v) for the pump assembly (1.5kw) and 1x13amp single phase supply (240v) for water heating and lighting (3kw). Larger installations will require additional supplies depending on total equipment provided.

WATER - One supply normally required @ minimum 2 bar (max. 5 bar), but can be supplied using tanks and booster pump if necessary.

There are modules to provide toilet cubicles, urinals, vanity units and accessible cubicles available. As each module width is based on multiples of 0.9m it is possible to install the modules in any order to provide flexible arrangements for any number of guests or configuration.

The system is primarily designed for use with vacuum drainage with low water usage and no need for chemicals but can be manufactured with a conventional gravity system if required.
